

Paragraph On Global Warming In 100 Words

Global warming, a dire environmental challenge, results from the accumulation of greenhouse gases like carbon dioxide and methane in the Earth's atmosphere. Primarily caused by human activities such as burning fossil fuels, deforestation, and industrial processes, it leads to a significant increase in the planet's average temperature. This warming triggers severe climate changes, including extreme weather events, rising sea levels, and the melting of polar ice. These changes threaten biodiversity, human health, and economies worldwide. Addressing global warming requires global cooperation to reduce greenhouse gas emissions, transition to renewable energy sources, and enhance conservation efforts, ensuring a sustainable future for all living beings on the planet.
