

Environmental Pollution

Paragraph 100 Words

Environmental pollution is a global crisis affecting air, water, and soil, leading to detrimental impacts on human health, wildlife, and the planet's ecosystems. Air pollution, from industrial emissions and vehicle exhaust, causes respiratory and cardiovascular diseases. Water pollution, through the discharge of industrial waste and chemicals into rivers and oceans, threatens aquatic life and contaminates drinking water. Soil pollution, from the use of pesticides and disposal of hazardous waste, degrades land fertility and food safety. Addressing these challenges requires collective action from individuals, communities, and governments worldwide, emphasizing sustainable practices and stringent environmental policies to safeguard our planet for future generations.
