

# Essay On Hen For Class 1

A hen is a bird that we often see on farms and in some backyards. Hens are known for laying eggs that we can eat. They come in different colors and sizes but all share common features like two legs, wings, and a beak.

Hens use their beak to peck at the ground to find food. They eat seeds, insects, and sometimes small plants. Despite having wings, hens usually cannot fly far. They use their wings mainly to flutter up to roosts or away from trouble.

One interesting thing about hens is they lay eggs. Even if there is no rooster, a hen will still lay eggs, but these eggs won't turn into chicks. When a hen does have eggs that can become chicks, she sits on them to keep them warm. After about three weeks, the eggs hatch, and little chicks come out.

Hens are social animals. They live in groups called flocks. In a flock, hens talk to each other using different sounds. They can warn each other of danger or call their chicks to food.
